    Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Score

Ig kappa chain V region (M-T406) - mouse (fragment)
C Species: Mus musculus (house mouse)
C Species: Mus musculus (house mouse)
C Species: Mus musculus (house mouse)
C Accession: $1995 #sequence_revision 06-Feb-1995 #text_change 21-Jan-2000
C Accession: $19974
R. Weissenhorn, W ; Riethmueller, G ; Weiss, E.M.; Rieber, E.P.
submitted to the EMBL Data Library, March 1992
A; Description: Structural characterization of CD4 mAb.
A; Reserence number: $19963
A; Accession: $19974
A; Status: preliminary
A; Molecule type: mRNA
A; Residues: 1-98 <WEI>
A; Cross-references: EMBL: X65096; NID: 952294; PIDN: CAA46224.1; PID: 952295
C; Superfamily: immunoglobulin V region; immunoglobulin homology
C; Keywords: heterotetramer; immunoglobulin homology
C; Keywords: immunoglobulin homology <IMM>

PHIOSI

Ig light chain V region (clone 165.3) - mouse (fragment)

C; Species: Mus musculus (house mouse)

C; Date: 30.5ep-1993 #sequence_revision 30.5ep-1993 #text_change 21-Jan-2000

C; Accession: PHIO51

R; Tillman, D.M.; Jou, N.T.; Hill, R.J.; Marion, T.N.

J. Exp. Med. 176, 761-779, 1992

A; Title: Both IgM and IgG anti-DNA antibodies are the products of clonally selective B c A; Reference number: PHO971; MUID:92381444

A; Accession: PHIO51

A; Status: nucleic acid sequence not shown

A; Molecule type: mRNA

A; Residues: 1-103 cril.>

A; Experimental source: B cell, strain [NZB x NZW]F1

C; Superfamily: immunoglobulin V region; immunoglobulin homology

C; Keywords: immunoglobulin homology <IMM>

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Sequence:
      Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Score

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Comodifications that comprise an inactivated endogenous immunopuloulin (Ig) Clocus, so that the mammal does not display normal B-cell development. The CC modified genome also has an inserted human heavy chain Ig locus in CC germline configuration, the human heavy chain Ig locus comprising a human CC micro constant region and regulatory and switch sequences, human J-H CC genes, human D-H genes, and human V-H genes and an inserted human kappa 1ght CC chain Ig locus in germline configuration, the human kappa light CC chain Ig locus comprising a human cappa constant region, J-kappa genes, CC and V-kappa genes, where the number of V-H and V-kappa genes inserted CC are selected to restore normal B-cell development in the mammal. The CC transgenic animals have a near complete human Ig locus, including both a CC transgenic animals have a near complete human Ig locus, including both a CC tham heavy chain locus and a human kappa light chain locus. They can CC constant antigens e.g. when exposed to human nitbodies when exposed to the mice will produce antibodies to IL-8, EGFR or TNF- alpha
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Matches

MAb D recognises vibrio cholera neuraminidase-resistant epitope of ganglioside GD2, from a human melanoma cell line. MAbs A, B and C (see AAW14484-89) are mentioned in the specification, but are not part of the claims. MAbs A and B recognise antigens 3 and 11 resp., of a permenant human tumour cell line. MAb C also recognises an epitope of a tumour-associated antigen. These antigens occur at high concns. In the serum of patients with gastrointestinal tumours, e.g. pancreatic carcinoma, and are thus useful as tumour markers for Alamonetic or the serum of patients with gastrointestinal for Alamonetic carcinoma, and are thus useful as tumour markers

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        밁
                                           AAW62793-822 represent fragments of human antibodies produced by Ctransgenic Xenomice, created using the method of the invention. The CC specification describes a transgenic non-human mammal which has genome cc modifications that comprise an inactivated endogenous immunoglobulin (Ig) clocus, so that the mammal does not display normal B-cell development. The cc modified genome also has an inserted human heavy chain Ig locus in germine configuration, the human heavy chain Ig locus comprising a human conicro constant region and regulatory and switch sequences, human J-H cc micro constant region and regulatory and switch sequences, human kappa (light chain Ig locus comprising a human v-H genes and an inserted human kappa (claim) in locus comprising a human kappa constant region, J-kappa genes, and human kappa constant region, J-kappa genes, and v-kappa genes, where the number of V-H and V-kappa genes inserted care selected to rescore normal B-cell development in the mammal. The ctransgenic animals have a near complete human ig locus, including both a human heavy chain locus and a human kappa light chain locus. They can comparticular antigens e.g. when exposed to human II-8, EGFR or TNF- alpha creaserively
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Green L,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                03-DEC-1996;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               03-DEC-1997;

                                       The present sequence represents the light chain of monoclonal antibody CC RS-348, which is directed against the respiratory syncytial virus (RSV). CC The specification describes peptides which recognise, by capture antibody type reactions, at least 1 epitope of a pathogenic virus compared to the mucosa. AMM70905-16 and AMM70929-46 are analogous CC to CDR regions of monoclonal antibodies specific for RSV. AMM70917-28 are capalogous to CDR regions of monoclonal antibodies specific for site III CC or IV of the VP6 protein of rota virus (RV). The peptides can neutralise CC uninfected cells or cells and viruses. They provide passive or active CC uninfected cells or cells and viruses. They provide passive or active CC peptides can be labelled and used to diagnose infection or contamination CC by the virus. The peptides are particularly directed against RSV or RS CC but may also be used against papilloma, adeno, entero, polio, influenza CC or immune deficiency viruses.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Query Match

                                                                                                       This polypeptide comprises the light chain variable region (VI) of monoclomal antibody (MAb) C9.88, which is produced by a hybridoma deposited as ATCC 12107, and which is specific for the gamma constant (gc) chain (see AAW31646) of human cytokine receptors. The invention provides compositions and methods for inhibiting cytokine signalling using gc chain blocking agents for the treatment of immunological diseases such as myssthenia gravis, rheumatoid arthritis, lupus, multiple sclerosis, insulin-dependent diabetes, allergy, asthma, parasitic infection, graft vs. host disease or psoriasis. Preferred gc blocking agents include MAb CP.88, its Fab fragment and an antibody having a light chain variable region calearty from those of cp na vicer heavy chain variable region

CMV, T-cell
conditions
                                    The sequence shows the humanised mature light chain variable region of the mouse Fd 138-80 antibody. Murine CDRs were used in a human Eu framework to produce a pure humanised immunoglobulin (Ig) which is capable of binding to a herpes simplex virus-specific epitope. The Ig is non immunogenic, due to the human framework, and has a strong affinity for its predetermined antigen. They can be produced in large quantitles via recombinant DNA and monocional antibody technology. The humanised Igs may be used alone or in combination with chemotherapeutic agents such as non-steroidal
                    anti-inflammatory drugs or immunosuppressants. See also AAR25721-32.
